

# REMOS™

**Revolutionising Traffic Management  
for a Safer, Greener Future**

**Designed to transform the way we manage temporary traffic works, REMOS introduces a new era where temporary traffic signals are controlled remotely, eliminating the need for onsite operatives, enhancing safety and reducing carbon emissions.**

#### **Data Capture**

REMOS is equipped with advanced radar sensors & CCTV cameras that continuously monitor traffic flow at the site and stream live footage of the area.

#### **Data Transmission**

Captured data is sent in real-time to SRL's Central Control Room via the SRL Control Hub to allow operators to access live traffic data of multiple sites, simultaneously.

#### **Proactive Management**

REMOS allows for more frequent interventions and adjustments to traffic signals, reducing the likelihood of traffic congestion and improving overall efficiency.

#### **SRL Control Hub**

This sophisticated, secure, web-based platform enables our trained operators to monitor live traffic flows, switch between automatic and manual modes, go to all red (if required) and control signal operations with precision, remotely.
